

A heatmap visualization showing the Average Normalized Compression for a 16x16 grid of configurations. The x and y axes are both labeled with integers from 1 to 16. A color bar on the right indicates the compression values, ranging from 0.60 (lightest orange) to 0.90 (darkest red). The heatmap shows a clear pattern of higher compression (darker red) in the center of the grid, particularly for configurations where both x and y are between 8 and 13, and lower compression (lighter orange) towards the edges.

## Average Normalized Compression
